

Students should modify the example scheduling scripts in the following manner and observe outcomes (via scheduler outputs)

- Reduce the number of jobs in the job array relative to the number of input lines.
- Increase the number of jobs in the job array relative to the number of input lines.
- Increase the total number of cores (select * ncpus) in the `gnu_parallel` example.
- Change the `-j` parameter (number of parallel tasks per node) in the parallel commands.
